

# BORROWED-LITE WINDOW FRAME KNOCK-DOWN CONSTRUCTION (FR-BL16-KD)

# INSTALLATION INSTRUCTIONS

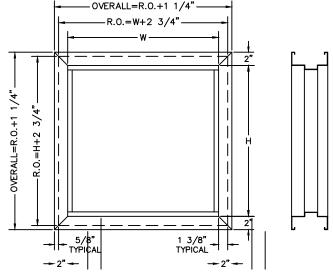

For 2" Trim

#### **INSTALLATION NOTES:**

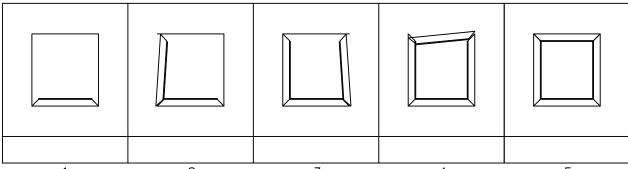

Two (2) of the components of the window frame must have two compression anchors (presure-fit screws) on each component. They must be installed opposite from each other. This will help ensure proper installation.

Before installing the components that have compression anchors, adjust the anchors by turning the bolt completely clockwise until it's locked.

Mark the wall around the perimeter of the rough opening 5/8" to give you a visual where the overall frame must be.

### **INSTALLATION STEPS:**

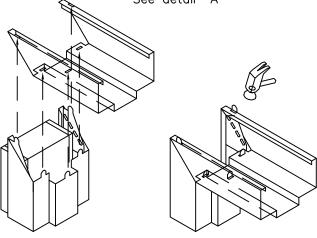

Install the window Install one vertical Install the other frame sill. window jamb. vertical window

Install one vertical window jamb.
Ensure the tabs on the jamb are located through the slots in the sill.
See detail "A"

Install the other vertical window jamb in the same manner as in step 2.

Install header and ensure the jamb tabs are located through the header slots. Secure the header and sill to the jambs by bending over the jamb tabs. See detail "B"

Using the pre marked wall, turn the compression bolts in the sill to raise the frame until the overall frame reaches the line. Do the same for the vertical jambs to center the frame in the rough opening. You must also compress the anchors in the header to secure the whole frame in the rough opening. Square and adjust the window frame before making the final adjustments with the compression anchors.
